

Final Essay Proposal

In my final essay, I want to delve into the critical issue of making sure that medical resources are fairly distributed and protected for those living in poverty. This involves offering medical subsidies, rolling out community health initiatives, and ensuring equal access to both medical care and educational resources, so the underprivileged don't miss out on vital treatment due to illness and lack of money.

As a college student, I often come across heart-wrenching news stories or social media posts about poor individuals who miss the best treatment window or even abandon treatment altogether because they can't afford it. This issue strikes a chord with me. I firmly believe that equal access to medical resources is a fundamental human right that every citizen deserves. Each year in China, thousands of impoverished people miss their chance for the best treatment or even lose their lives because they can't afford medical care or medication. Though I'm not a medical student, I feel a strong urge to contribute to solving this problem. It angers me to see how the wealth gap creates barriers to basic medical services.

This topic is also paramount for health and medical researchers, as ensuring that impoverished populations have access to medical resources is a significant challenge that healthcare professionals must address. It has a profound impact on public health and society. By researching this field, we can bridge the healthcare gap and enhance the well-being of vulnerable groups. Understanding the underlying causes of unequal healthcare opportunities and exploring practical solutions enables researchers to develop evidence-based strategies to promote health equity and social justice.

In conclusion, the issue of ensuring basic medical insurance for the impoverished population is compelling both personally and academically. Through comprehensive exploration and analysis, we can collectively pinpoint and address the gaps that result in inadequate healthcare for the impoverished population.
